

CORPORATE OVERVIEW

Message Partners specializes in building integration software for email security and regulatory compliance. We built our expertise as the US distributor for European antivirus and antispam products, supporting thousands of customers who required email server based virus and spam protection. We applied our expertise when creating the Message Processing Platform (MPP) – A policy driven email security integration platform and the first commercial integration application of its kind. The MPP enables forward-thinking security architectures by integrating comprehensive policy tools with embedded security and best-of-breed commercial and open-source technology. We integrate many popular email security packages and feature centralized quarantine and archiving databases and directory-based provisioning.

Message Partners was launched as a subsidiary of RAE Internet in January of 2005 by Michael Katz, a seven-year veteran of Cisco Systems. Mr. Katz worked with some of Cisco's most prominent customers in finance, banking, insurance as well as leading ISP's, MSO's and next generation service providers in the New York City metro area. RAE Internet was initially launched in 2000 and remains as a reseller and distributor dedicated to the email security and antivirus markets.

Message Partners has important partnerships with some of the most respected leaders in the email security marketplace including Cloudmark, Sophos, F-PROT and others.
